# Regularization

## 1. Overfitting

- Underfitting, or high bias, is when the form of our hypothesis function h maps poorly to the trend of the data.
- Overfitting, or high variance, is caused by a hypothesis function that fits the available data but does not generalize well to predict new data.

### Addressing

- Reduce the number of features (manually select, model selection).
- Regularization (keep all the features, but reduce the magnitude of parameters).

# 2. Regularized Linear Regression

$$\min_{\theta} \frac{1}{2m} \left[ \sum_{i=1}^m (h_{\theta}(x^{(i)}) - y^{(i)})^2 + \lambda \sum_{j=1}^n \theta_j^2 \right], \text{ where } h_{\theta}(x) = \theta^T x$$

Normal equation

$$\theta = (X^TX + \lambda \cdot L)^{-1}X^Ty \text{where } L = \begin{bmatrix} 0 & & & \\ & 1 & & \\ & & \ddots & \\ & & & 1 \end{bmatrix}$$

Proof.

$$\left\{ \begin{array}{ll} \frac{\partial}{\partial \theta_j} J(\theta) = \frac{1}{m} \sum_{k=1}^m (\theta^T x^{(k)} - y^{(k)}) x_j^{(k)} & (j=0) \\ \frac{\partial}{\partial \theta_j} J(\theta) = \frac{1}{m} \sum_{k=1}^m (\theta^T x^{(k)} - y^{(k)}) x_j^{(k)} + \frac{\lambda}{m} \theta_j & (j\in N^+) \end{array} \right. \\ \Rightarrow \nabla_{\theta} J(\theta) = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} (X^T X \theta - X^T y) + \frac{\lambda}{m} L \theta = \frac{1}{m} L \theta = \frac{1}{m} L \theta = \frac$$

# 3. Regularized Logistic Regression

$$\min_{\theta} \left[ -\frac{1}{m} \sum_{i=1}^{m} \left( y^{(i)} \mathrm{log} h_{\theta}(x^{(i)}) + (1-y^{(i)}) \mathrm{log} (1-h_{\theta}(x^{(i)})) \right) + \frac{\lambda}{2m} \sum_{j=1}^{n} \theta_{j}^{2} \right]$$

# 4. MLE & MAP

#### Preliminaries

- $\ {\mathbb D}$  Assume data are generated via  $d \sim p(d;\theta)$
- $\ \square\ D=\{d^{(i)}\}_{i=1,2,\cdots,m}$  , where  $d^{(i)}$  is i.i.d. (independent of others and same distribution).
- $\ensuremath{\mathbb{I}}$  Goal: Estimate parameter  $\theta$  that best models the data.

#### Maximum Likelihood Estimation (MLE)

- $\begin{array}{l} \mathbb{I} \ \ \text{Likelihood:} \ L(\theta) = p(D;\theta) = \prod_{i=1}^m p(d^{(i)};\theta) \\ \mathbb{I} \ \ \text{MLE typically maximizes the log-likelihood} \ l(\theta). \\ \mathbb{I} \ \ \theta_{MLE} = \arg\max_{\theta} \ \sum_{i=1}^m \log p(d^{(i)};\theta) \end{array}$

#### Maximum-a-Posteriori Estimation (MAP)

- $\ensuremath{\mathbb{I}}$  MAP usually maximizes the log of the posteriori probability
- $\mathbb{I} \ \theta_{MAP} = \arg\max_{\theta} \ \left( \log p(\theta) + \sum_{i=1}^{m} \log p(d^{(i)}|\theta) \right)$

#### Linear Regression

#### 1. MLE

$$\begin{array}{l} \mathbb{I} \ \ \text{Suppose} \ y^{(i)} = \theta^T x^{(i)} + \epsilon^{(i)} \text{, where} \ \epsilon \sim \mathcal{N}(0,\sigma^2) \\ - \ \ \text{Normal Distribution} \ p(x;\mu,\sigma) = \frac{1}{(2\pi\sigma^2)^{1/2}} \exp\left(-\frac{1}{2\sigma^2}(x-\mu)^2\right) \\ \mathbb{I} \ \ p(d^{(i)};\theta) = \frac{1}{\sigma\sqrt{2\pi}} \exp(-\frac{1}{2\sigma^2}(y^{(i)}-\theta^T x^{(i)})^2) \ \Rightarrow \ \log p(d^{(i)};\theta) = \log \frac{1}{\sigma\sqrt{2\pi}} - \frac{1}{2\sigma^2}(y^{(i)}-\theta x^{(i)})^2 \\ \mathbb{I} \ \ \theta_{MLE} = \arg \min_{\theta} \sum_{i=1}^m (y^{(i)}-\theta^T x^{(i)})^2 \end{array}$$

#### 2. MAP

$$\begin{array}{l} \mathbb{I} \ \ \text{Suppose} \ \epsilon \sim \mathcal{N}(0,\sigma^2), \theta \sim \mathcal{N}(0,\lambda^2I) \\ \qquad - \ \ \text{Multivariate normal distribution} \ p(x;\mu,\Sigma) = \frac{1}{(2\pi)^{n/2}|\Sigma|^{1/2}} \exp\left(-\frac{1}{2}(x-\mu)^T\Sigma^{-1}(x-\mu)\right) \\ \qquad - \ \ \text{where} \ \mu \in \mathbb{R}^n, \Sigma \in \mathbb{R}^{n\times n} \ \text{is symmetric and postitive semidefinite} \\ \mathbb{I} \ \ p(\theta) = \frac{1}{(\sqrt{2\pi}\lambda)^n} \exp(-\frac{1}{2\lambda}\theta^T\theta) \Rightarrow \log \ p(\theta) = n\log\frac{1}{\sqrt{2\pi}\lambda} - \frac{\theta^T\theta}{2\lambda^2} \\ \mathbb{I} \ \ \theta_{MAP} = \arg \min_{\theta} \left\{ \sum_{i=1}^m (y^{(i)} - \theta^T x^{(i)})^2 + \frac{\theta^T\theta}{2\lambda^2} \right\} \end{array}$$

# 3. MLE vs MAP

- MLE (unregularized solution) vs MAP (regularized solution)
- The prior distribution acts as a regularizer in MAP estimation

# Logistic Regression

Similar conclusion as above.
