Matrix Calculus

Gradient

Def. Directional Derivative

The directional derivative of function $f:\mathbb{R}^n \to \mathbb{R}$ in the direction u is

$$\nabla_u f(x) = \lim_{h \to 0} \frac{f(x+hu) - f(x)}{h}$$

- When u is the i-th standard unit vector e_i , then $\nabla_u f(x) = f_i'(x) = \frac{\partial f(x)}{\partial x_i}.$
- For any n-dimensional vector u, the directional derivative of f in the direction of u can be represented as $\nabla_u f(x) = \sum_{i=1}^n f_i'(x) \cdot u_i.$

$$\begin{array}{c} \operatorname{let} g(h) = f(x+hu) \\ \nabla_u f(x) = g'(0) = \lim\limits_{h \to 0} \frac{f(x+hu) - g(0)}{h} \\ \vdots g'(h) = \sum_{i=1}^n f_i'(x) \frac{d}{dh} (x_i + hu_i) = \sum_{i=1}^n f_i'(x) u_i \\ \operatorname{let} h = 0 \ \vdots \nabla_u f(x) = \sum_{i=1}^n f_i'(x) u_i \end{array}$$

Def. Gradient

The gradient of f is a vector function $\nabla f:\mathbb{R}^n \to \mathbb{R}^n$ defined by

$$\begin{split} \nabla f(x) &= \sum_{i=1}^n \frac{\partial f}{\partial x_i} e_i \\ \Rightarrow & \nabla f(x) = \left[\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \cdots, \frac{\partial f}{\partial x_n} \right] \end{split}$$

- + $\nabla_u f(x) = \nabla f(x) \cdot u = ||\nabla f(x)|| \text{cos } a \text{ Where } u \text{ is a unit vector.}$
- When $u = \nabla f(x)$ such that a = 0, we have the maximum directional derivative of f.

Matrix Derivatives

• The derivative of $f: \mathbb{R}^{m \times n} \to \mathbb{R}$ with respect to A is defined as:

$$\nabla f(A) = \begin{bmatrix} \frac{\partial f}{\partial A_{11}} & \dots & \frac{\partial f}{\partial A_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial f}{\partial A_{m1}} & \dots & \frac{\partial f}{\partial A_{mn}} \end{bmatrix}$$

trace

Def.
$$trA = \sum_{i=1}^{n} A_i i$$

- trABCD = trDABC = trCDAB = trBCDA
- $trA = trA^T$, tr(A + B) = trA + trB, $tr(aA) = a \cdot trA$

- $\begin{array}{l} \bullet \ \, \nabla_A trAB = B^T, \nabla_{A^T} f(A) = (\nabla_A f(A))^T \\ \bullet \ \, \nabla_A trABA^TC = CAB + C^TAB^T, \nabla_A |A| = |A|(A^{-1})^T \\ \bullet \ \, \text{Funky trace derivative } \nabla_{A^T} trABA^TC = B^TA^TC^T + BA^TC \end{array}$

Jacobian Matrix

$$\mathbf{J} = \begin{bmatrix} \frac{\partial \mathbf{f}}{\partial x_1} & \cdots & \frac{\partial \mathbf{f}}{\partial x_n} \end{bmatrix} = \begin{bmatrix} \frac{\partial f_1}{\partial x_1} & \cdots & \frac{\partial f_1}{\partial x_n} \\ \vdots & \ddots & \vdots \\ \frac{\partial f_m}{\partial x_1} & \cdots & \frac{\partial f_m}{\partial x_n} \end{bmatrix}$$

Hesse Matrix

$$G(x_0) = \begin{bmatrix} \frac{\partial^2 f}{\partial x_1^2} & \frac{\partial^2 f}{\partial x_1 \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_1 \partial x_n} \\ \\ \frac{\partial^2 f}{\partial x_2 \partial x_1} & \frac{\partial^2 f}{\partial x_2^2} & \cdots & \frac{\partial^2 f}{\partial x_2 \partial x_n} \\ \\ \vdots & \vdots & \ddots & \vdots \\ \\ \frac{\partial^2 f}{\partial x_n \partial x_1} & \frac{\partial^2 f}{\partial x_n \partial x_2} & \cdots & \frac{\partial^2 f}{\partial x_n^2} \end{bmatrix}_{x_0}$$

•
$$H(f) = J(\nabla f)$$
