Linear Regression

Basics

- Linear hypothesis: $h(x) = \theta_1 x + \theta_0$, $\theta_i (i = 1, 2$ for 2D cases).
- cost function:

$$J(\theta) = \frac{1}{2} \sum_{i=1}^{m} (h_\theta(x^{(i)}) - y^{(i)})^2, \quad h_\theta(x) = \sum_{i=0}^{n} \theta_i x_i = \theta^T x$$

- best choice for $\theta = \arg\min_\theta J(\theta)$

Gradient Descent (GD) Algorithm

Algorithm.

```
Given a starting point \theta in dom J
while converence criterion is satisfied
  Calculate gradient \nabla J(\theta)
  Update \theta \leftarrow \theta - \alpha\nabla J(\theta)
```

θ Is usually initialized randomly, and α is so-called learning rate.

- For linear regression,

$$\theta_j \leftarrow \theta_j - \alpha \frac{\partial J(\theta)}{\partial \theta_j}, \ \forall j = 0, 1, \cdots, n, \ x_0^{(i)} = 1$$

$$\frac{\partial J(\theta)}{\partial \theta_j} = \frac{\partial}{\partial \theta_j} \frac{1}{2} \sum_{i=1}^{m} (\theta^T x^{(i)} - y^{(i)})^2$$

$$= \frac{\partial}{\partial \theta_j} \frac{1}{2} \sum_{i=1}^{m} (\sum_{j=0}^{n} \theta_j x_j^{(i)} - y^{(i)})^2$$

$$= \sum_{i=1}^{m} (\theta^T x^{(i)} - y^{(i)}) x_j^{(i)}$$

- Another commonly used form $J(\theta) = \frac{1}{2m} \sum_{i=1}^{m} (h_\theta(x^{(i)}) - y^{(i)})^2$.
- m is introduced to scale the objective function to deal with differently sized training set.

Matrix Form

$$X = \begin{bmatrix} (x^{(1)})^T \\ \vdots \\ (x^{(m)})^T \end{bmatrix}, Y = \begin{bmatrix} y^{(1)} \\ \vdots \\ y^{(m)} \end{bmatrix} \quad J(\theta) = \frac{1}{2} \sum_{i=1}^{m} (\theta^T x^{(i)} - y^{(i)})^2 = \frac{1}{2} (X\theta - Y)^T (X\theta - Y)$$

- Minimize $J(\theta) = \frac{1}{2} (Y - X\theta)^T (Y - X\theta)$

$$\nabla_\theta J(\theta) = \nabla_\theta \frac{1}{2}(Y - X\theta)^T(Y - X\theta)$$

$$= \frac{1}{2}\nabla_\theta tr(Y^TY - Y^TX\theta - \theta^TX^TY + \theta^TX^TX\theta)$$

$$= \frac{1}{2}\nabla_\theta tr(\theta^TX^TX\theta) - X^TY$$

$$= \frac{1}{2}(X^TX\theta + X^TX\theta) - X^TY$$

$$= X^TX\theta - X^TY$$

□ Theorem. Normal Equation

The matrix A^TA is invertible if and only if the columns of A are linearly independent. In this case, there exists only one least-squares solution.

$$\theta = (X^TX)^{-1}X^TY$$
